This drone can do remarkable things. It does not fly alone, but rather flies with a group of similar drones and can form patterns in the sky.

Each drone carries 9 RGB color-changing LED lights which can be used to create patterns, logos and animations. It is limited only by your imagination!

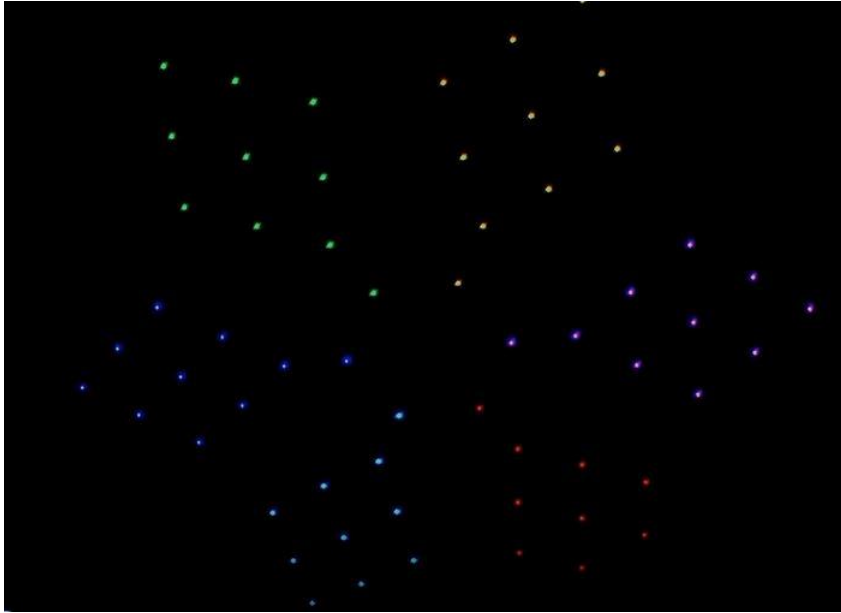

What is most interesting is that a fleet of PowerBees can be directed to perform in formation.

This attribute can be used to portray a vivid design in the

sky. The array can be controlled by as few as one person.

PowerBee includes intelligent collision avoidance and safety zone control to protect operational safety.

When flight is combined with a source of music, positioning and movement of the drone array can be coordinated to produce an impressive performance.
