One of the more interesting products I saw at CES helps you control your dog.

It uses a “smart” collar, which means it is an **IoT** application, connecting with an app on your smart phone. "IoT" stands for "Internet of Things".

It uses GPS to track your dog, allowing you to see where it is at any time. You'll never lose your dog again.

It tracks your dog's activity to be sure he or she is getting

enough exercise. It totals the daily calories your dog uses so that you can provide more exercise if needed to keep him or her healthy.

The collar has a camera which streams live HD views of what your dog sees.

It contains substitutes for a leash with the built-in ultrasonic sensors and gentle vibration. Your dog feels the vibration and comes back near you to continue the walk. The sensors can also be used to create an invisible geo fence.

The collar has lights which illuminate when in the presence of bright lights, to warn oncoming traffic of your dog's presence.

I believe this will be a popular product for dog lovers!

The product is not available yet, but will be in a month or so. It can be pre-ordered from the company for delivery when available.
